

This document contains the visualizations I created for the data analysis project. The approach I used to create them was to plot the information I want to find out against the timeline I had available (2020-2022) from three datasets, in order to have an idea of the status and future projections of the data.

In terms of coding, I used the Pandas' "Groupby" function to find the sum/average/count of each continent according to a certain feature, and then assigned the result to a variable. I then used Matplotlib to plot the data found in the variable.

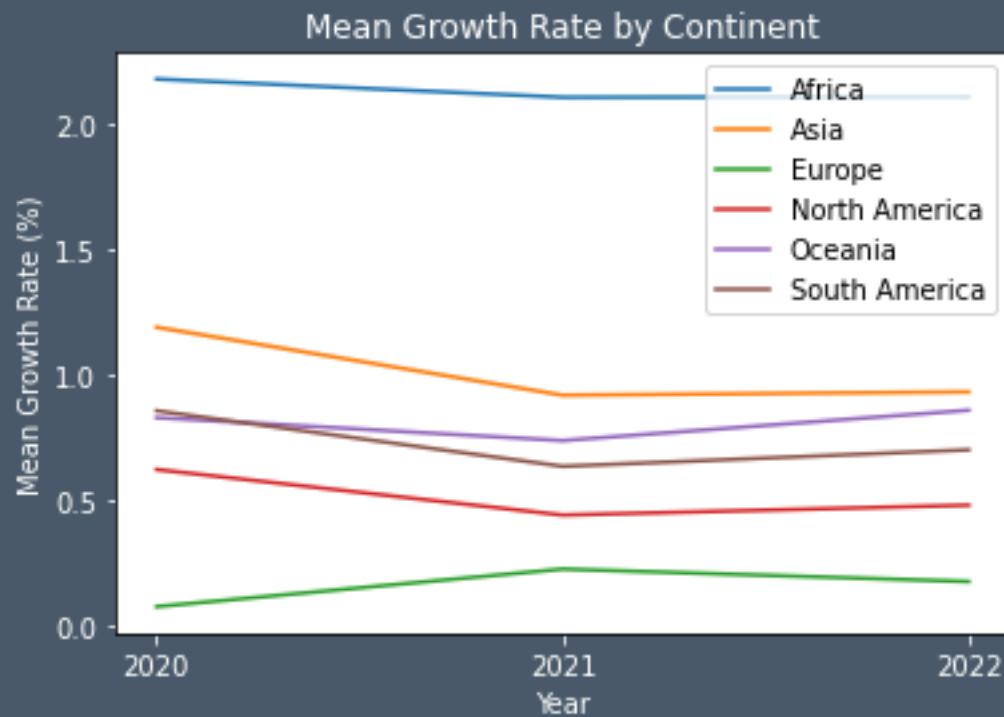

For the last question "Which countries have a negative growth?", I created a variable containing only negative entries from the "growth rate" feature.

Continent populations 2020

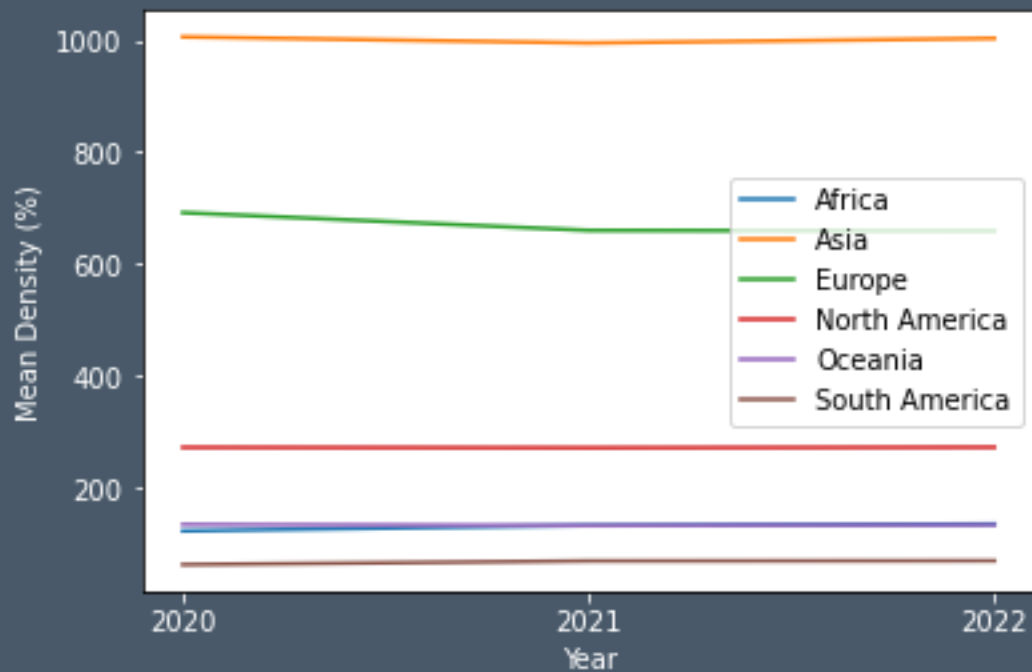

Continent populations 2021

Average density by Continent

Growth Rates Per Continent (2022)

Growth Rates Per Continent (2021)

Growth Rates Per Continent (2020)

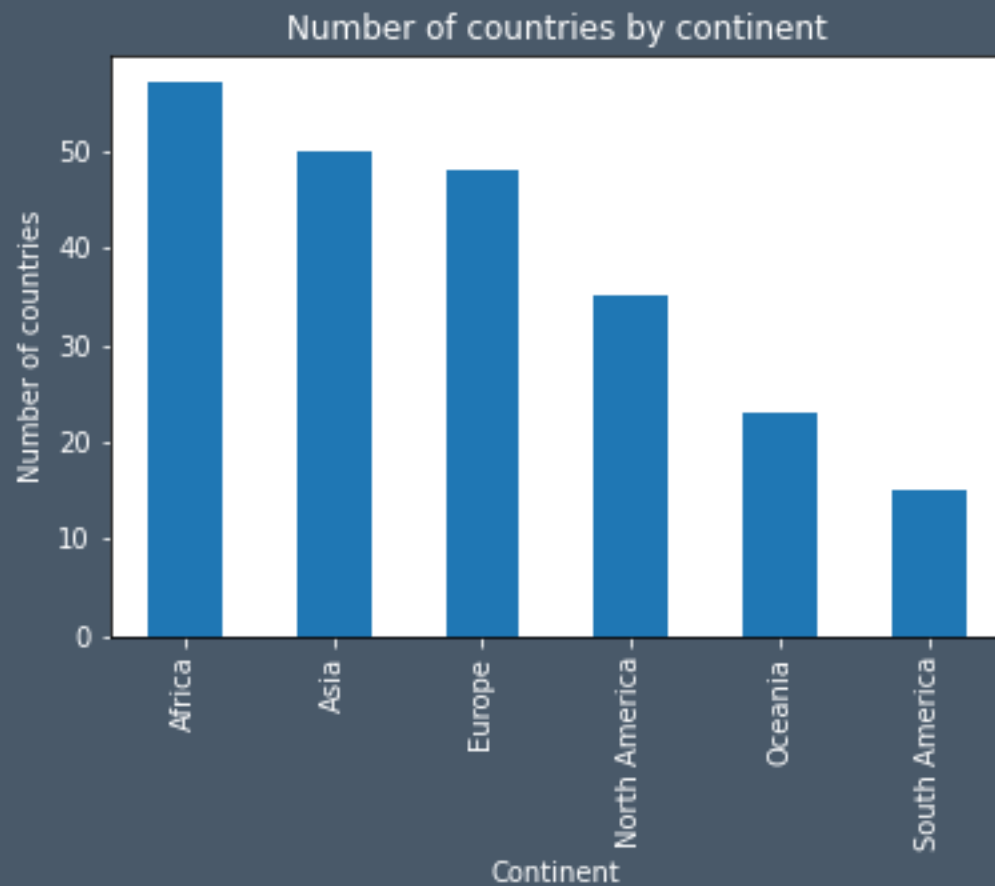

Continent Landmass
